

VYAS · TIME DOMINATION SYSTEM

COMMAND CENTER

The Business Owner's Guide to Time Domination

*Stop running your business one fire at a time.
Start running it on purpose.*

A practical guide to capturing, routing, scheduling, and reviewing your way to more focused, higher-value hours.

COMMANDCENTER Capture -> Route -> Schedule -> Review

Why This Is Worth It

Quick Reference

— INTRODUCTION

Why This Exists

Every business owner runs out of the same resource first — not money, not ideas, time. And most of it disappears not to the big decisions that actually move the business, but to the hundred small things that felt urgent in the moment: the reply that could have waited, the meeting that didn't need you, the task that quietly took two hours because nothing was written down anywhere.

Command Center digitizes a simple, disciplined answer to that problem — the Vyas “Time Domination” system. It's a four-step loop: capture everything the moment it enters your head, route it honestly by what it actually is, schedule the work that deserves your specific attention, and review on a fixed weekly rhythm so nothing quietly falls through. It runs on every device, syncs automatically, and asks nothing of you except five honest minutes a day and fifteen on Sunday.

Who this is for

Command Center is built for the owner-operator who is the bottleneck in their own business — the one whose calendar, inbox, and to-do list have quietly become the same thing. If you've ever ended a long day unable to say what you actually accomplished, this system is built to fix exactly that.

The rest of this guide walks through the philosophy, every module in the app, and a first-week routine to get it running properly — followed by a one-page quick reference you can keep next to your desk.

THE CORE IDEA

Your Most Important Number: Owner Hour Value

Command Center's Settings tab opens with a single calculation that changes how every task on your list looks:

$$\text{Owner Hour Value} = \text{Monthly income (or revenue you're responsible for)} \div \text{Working hours per month}$$

Set it once in Settings, and it stays pinned in the header of every screen — a constant, honest reminder of what your hour is actually worth. From that point on, every task you capture gets a simple test: is this worth my time, or someone else's?

It's not an abstraction. Command Center actively flags tasks in categories that typically sit below an owner's hour value — admin and marketing busywork, most often — with a quiet “delegate?” nudge right in the Capture inbox. You can customize which categories exist in Settings, so the flag lines up with how your business actually talks.

Why this matters more than any single feature

Most task managers treat every item on your list as equally worthy of your attention. Command Center starts from the opposite assumption: your time is the scarcest, most expensive resource in the business, and the software's job is to keep reminding you of that until delegating the right things becomes a reflex, not a decision you have to remember to make.

HOW IT WORKS

The System: Capture, Route, Schedule, Review

Everything in Command Center runs through one loop. Understanding it is the difference between using the app as a glorified notes file and using it the way it's designed to be used.

1. Capture. The instant a task, idea, or worry crosses your mind, it goes into the Capture inbox — nothing more than the raw thought. No categorizing, no deciding, no judgment. The goal is speed: get it out of your head and onto the screen so your brain stops holding onto it.

2. Route. On your own schedule — not in the moment of capture — you go through the inbox and give each item a Category and a Task Type. The Task Type is the important one: it's an honest classification (Fixed appointment? Delegate to someone? Not committed yet? No value at all?) that determines exactly where the item goes next.

3. Schedule. Pressing **Transfer** routes the item automatically: time-bound and delegated work goes to Daily backup, recurring weekly work to Weekly someday, monthly fixed commitments to the Monthly tray, undecided ideas to Maybe, and pure information to Reference. Nothing moves until you decide — Transfer is a manual, deliberate action, never automatic.

4. Review. A five-minute evening closure each day and a fifteen-minute review each Sunday keep the whole system honest. This is the step almost every task manager skips — and the one that actually makes the system self-correcting instead of one more list you stop trusting.

MODULE 1

Capture

01

Capture

Everything starts here — the inbox for your brain

Capture is deliberately dumb: one text box, hit Enter, done. Don't stop to think about category or priority while you're capturing — that's a separate step, and mixing the two is the single biggest reason people abandon capture systems. Speed beats structure here.

Once something is in the inbox, give it a **Category** (which area of the business it belongs to) and a **Task Type** — the field that actually matters, because it decides where the item goes on Transfer:

- **Schedule** — has a fixed date/time -> Daily backup, ready to place in a block.
- **Daily / Waiting / Project** — ongoing or flexible work -> Daily backup routine.
- **Weekly** — repeats every week -> the Weekly someday column.
- **Monthly** — repeats every month (tax dates, rent, payroll) -> the Monthly tray.
- **Delegate / Waiting-for** -> Daily backup, and automatically tracked in Follow-up.
- **Maybe** -> the Maybe list, parked with a mandatory revisit date.
- **Reference / Automate** -> Reference notes — information, not action.
- **Delete** — no value. The most satisfying type to choose.

You can also set a due date and time on any item right in Capture, before it's even transferred — useful for anything that already has a fixed slot.

How to use it well

Capture the moment something interrupts you, then get straight back to what you were doing. Batch the routing/triage step — once in the morning, once before you close out the day — rather than triaging every single item the instant it lands. That separation is what keeps Capture fast enough to actually use under pressure.

MODULE 2

Follow-up

02

Follow-up

Where delegated work goes to actually get finished

This is the module most task managers don't have — and the one that quietly costs business owners the most time. You hand something off, assume it's handled, and three weeks later discover it never happened. Follow-up exists specifically to close that gap.

Every item routed as **Delegate** or **Waiting-for** lands here automatically, grouped by the person it's assigned to. Add your team members once in Settings, assign work to them from Capture or right here, and this screen becomes your chase list — one place to see everything sitting on someone else's desk, with the due date attached.

Mark an item resolved when it's genuinely done or back in your hands. It doesn't disappear silently — you close the loop on purpose, every time.

How to use it well

Check Follow-up once a week, ideally right before or after your Sunday review. A five-minute scan is usually enough to catch the one thing that's been quietly stuck for two weeks — before it becomes a client-facing problem.

MODULE 3

Daily

03

Daily

One outcome, three priorities, an honest evening close

Daily is built around a deliberately narrow question: if only one thing gets done today, what has to be it? You set that **one main outcome**, then a maximum of **three priorities** underneath it. The cap is intentional — a list of fifteen priorities is a list with none.

Below that sits an hour-by-hour Plan / Actual chart from 7 AM to 10 PM. Anything with a due date and time — wherever you captured it — shows up automatically in its matching slot, editable right there, so the chart fills itself in around what's already scheduled.

The day closes with a five-minute evening ritual: what ate the day, one family or personal commitment, and an honest score from 0 to 3. This is the step that turns a planner into a feedback loop — you start to see, week over week, exactly what keeps derailing your plan.

How to use it well

Fill in tomorrow's outcome and priorities the night before, not the morning of — ideally right after the evening closure. Deciding under pressure at 9 AM almost always produces a worse plan than deciding calmly at 9 PM.

MODULE 4

Weekly

04

Weekly

The fifteen minutes that shape your entire week

Every Sunday, Weekly is where the week actually gets planned — a full 7-day, hour-by-hour grid, filled in a specific order that protects what matters before the calendar fills itself with everyone else's requests:

- **Fixed commitments first** — anything that genuinely cannot move.
- **Focus blocks next, before meetings** — at least three blocks of deep, uninterrupted work on the business, not just in it.
- **Meeting zones** — group the unavoidable calls and check-ins together instead of letting them fragment the whole week.
- **Buffer last** — space for whatever inevitably goes sideways.

Command Center enforces the discipline with three non-negotiables tracked at the top of the screen: three-plus focus blocks, one review slot, one family block. Day themes (Monday for hiring, Tuesday for finance, and so on) sit above the grid, global across every week, and cut down on the mental cost of switching contexts all day.

Anything routed as Weekly and given a specific day and time recurs automatically — every week, on that day, at that time — in both Weekly and Daily, with a simple checklist to mark it done for that week without losing the recurrence.

How to use it well

Protect the order. It's tempting to let meeting requests fill the calendar first and squeeze focus time into whatever's left — that's exactly backwards, and it's how a business owner's week quietly turns into eight hours a day of responding to other people's priorities.

MODULE 5

Monthly

05

Monthly

Only what's truly fixed — nothing else

Monthly is intentionally sparse. It holds deliveries, tax and compliance dates, large payments, family commitments, and health — the handful of things per month that are genuinely fixed and cannot be renegotiated. Goals and projects belong in Weekly and Daily, not here; mixing the two turns Monthly into noise.

Mark exactly two buffer days each month — slack built in on purpose for the things that will inevitably go wrong, because they always do.

Recurring monthly commitments (GST filing, rent, payroll) only need to be placed on a date once. From then on, Command Center backfills that same day-of-month into every future month automatically, and it shows up in Daily and Weekly too, right on the day it lands.

Click any date on the calendar to open that exact day in Daily — the fastest way to move from the month-level view down to what actually needs to happen.

MODULE 6

Maybe

06

Maybe

A parking lot for ideas — not a graveyard

Not every idea deserves a decision today. “Second location,” “new hire,” “that product idea” — Maybe is where these go so they stop occupying working memory, without you having to pretend you'll never think about them again.

Every item parked here gets a **revisit date** — not optional. Parking something without a date to reconsider it is just a nicer way of losing it. When the date arrives, either **Commit** — which sends it straight back into Capture for real routing — or re-park it with a fresh date.

MODULE 7

Reference

07

Reference

Information that needs no action, kept out of your task list

A GST number, a vendor's account details, a link you'll need again — Reference is a home for information that isn't a task at all. Keeping it out of Capture and the daily backup lists is what keeps those lists trustworthy: everything left in your active lists genuinely requires action from you.

MODULE 8

Settings

08

Settings

Tune the system to how your business actually runs

Settings is where Command Center stops being a generic planner and starts matching your business specifically:

- **Owner Hour Value** — set income and working hours; the number stays pinned in the header everywhere.
- **Categories** — fully editable. Rename, add, or remove to match how your business actually talks about its work.
- **Task type labels** — rename how each of the built-in task types displays without touching how they route — the underlying logic stays safe either way.
- **Team members** — the people you delegate to, used throughout Capture and Follow-up.
- **Data** — export a full backup as JSON at any time, import one back, or wipe everything and start clean from the Danger Zone.

GETTING STARTED

Your First Week with Command Center

The system works because of the rhythm, not any individual screen. Here's how to get that rhythm running in your first seven days.

Day 1 — Set the foundation

Set your Owner Hour Value in Settings. Add your team members if you delegate work to anyone.

Do a full brain dump into Capture — everything on your mind, work and personal, no filtering. Fifteen to thirty minutes, done properly, is usually enough to feel a genuine sense of relief.

Day 1-2 — Route the dump

Go back through the inbox and assign a Task Type to everything. Don't overthink any single item — a rough decision made now beats a perfect one made never. Transfer as you go.

Every morning — Daily

Before checking email or your phone, open Daily and confirm the one outcome and three priorities you set the night before (or set them now if this is day one).

Every evening — Closure

Five minutes: what ate the day, one personal or family commitment, and a score from 0 to 3. Then set tomorrow's outcome and priorities while today is still fresh.

Sunday — Weekly review

Fifteen minutes. Fill next week's grid in order — fixed, then focus, then meetings, then buffer. Check Follow-up for anything that's gone quiet.

Once a month — Monthly review

Confirm fixed commitments for the month ahead, mark your two buffer days, and glance at recurring items to make sure nothing needs adjusting.

THE BOTTOM LINE

Why This Is Worth It

Unmanaged time doesn't just cost hours — it costs the decisions those hours would have gone toward. Every hour an owner spends on work that sits below their own Owner Hour Value is an hour that didn't go toward the hire, the client conversation, or the strategic call that only the owner can make.

That's the cost Command Center is built to reduce, and it does it without asking you to become a different kind of person. It doesn't require willpower you don't have — it requires five honest minutes a day and fifteen on Sunday, and it does the remembering for you in between.

What changes after a few consistent weeks:

- Less firefighting — because almost nothing is only living in your head anymore.
- Delegated work actually finishes — because Follow-up makes it visible until it does.
- Fewer dropped commitments — due dates surface automatically across Daily, Weekly, and Monthly, not just in the list where you first typed them.
- A weekly rhythm instead of a growing to-do list — the difference between running the business and being run by it.

Command Center runs on every device, installs like a native app, and takes less than twenty minutes to set up properly. Your time is the one asset in the business that never comes back once it's spent. Start spending it on purpose.

CHEAT SHEET

Quick Reference

Keep this page open until the rhythm becomes automatic.

Task Type	Where it goes
Schedule	Daily backup — place it in a time block
Daily	Daily backup — the everyday routine checklist
Weekly	Weekly someday — recurs on its day, every week
Monthly	Monthly tray — recurs on its date, every month
Waiting / Project	Daily backup — flexible or multi-step work
Delegate / Waiting-for	Daily backup, and tracked in Follow-up
Maybe	Maybe list — parked with a mandatory revisit date
Reference / Automate	Reference notes — information, not action
Delete	Gone. No value.

The daily rhythm

- **Morning:** open Daily, confirm one outcome + three priorities.
- **Throughout the day:** capture the instant something crosses your mind; don't triage in the moment.
- **Evening:** five-minute closure — what ate the day, one family commitment, score 0–3.

The weekly rhythm

- **Sunday:** fill next week's grid — fixed -> focus -> meetings -> buffer.
- **Sunday:** scan Follow-up for anything that's gone quiet.
- **Monthly:** confirm fixed commitments, mark two buffer days.
